Introduction to Data Mining

4/18/2004

_

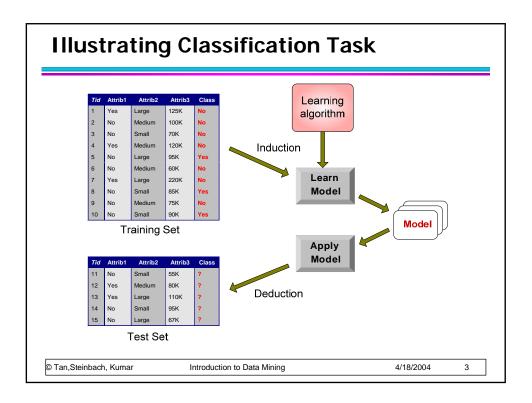

Classification: Definition

- Given a collection of records (training set)
 - Each record contains a set of attributes, one of the attributes is the class.
- Find a model for class attribute as a function of the values of other attributes.
- Goal: <u>previously unseen</u> records should be assigned a class as accurately as possible.
 - A test set is used to determine the accuracy of the model. Usually, the given data set is divided into training and test sets, with training set used to build the model and test set used to validate it.

4/18/2004

Examples of Classification Task

- Predicting tumor cells as benign or malignant
- Classifying credit card transactions as legitimate or fraudulent

4/18/2004

- Classifying secondary structures of protein as alpha-helix, beta-sheet, or random coil
- · Categorizing news stories as finance, weather, entertainment, sports, etc

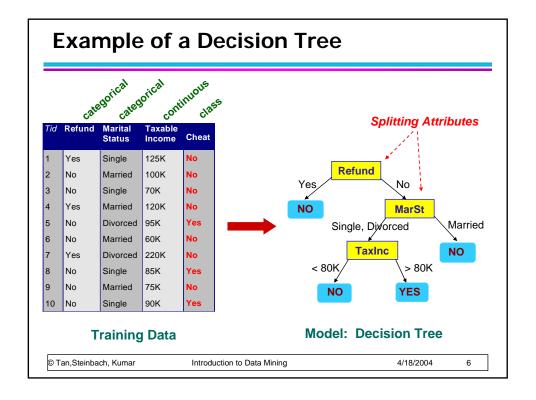

© Tan,Steinbach, Kumar

Decision Tree Induction

- Many Algorithms:
 - Hunt's Algorithm (one of the earliest)
 - CART
 - ID3, C4.5
 - SLIQ, SPRINT

General Structure of Hunt's Algorithm

- Let D_t be the set of training records that reach a node t
- General Procedure:
 - If D_t contains records that belong the same class y_t, then t is a leaf node labeled as y_t
 - If D_t is an empty set, then t is a leaf node labeled by the default class, y_d
 - If D_t contains records that belong to more than one class, use an attribute test to split the data into smaller subsets. Recursively apply the procedure to each subset.

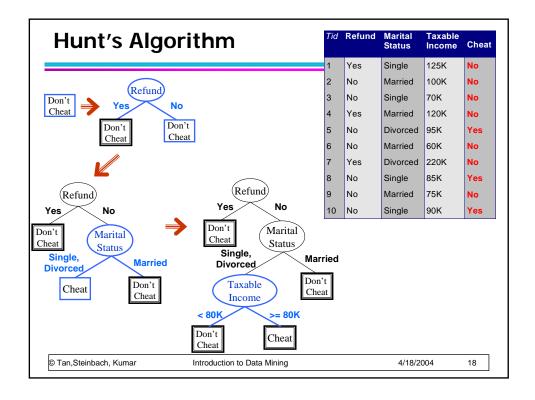

Tid	Refund	Marital Status	Taxable Income	Cheat

How to Specify Test Condition?

- Depends on attribute types
 - Nominal
 - Ordinal
 - Continuous
- Depends on number of ways to split
 - 2-way split
 - Multi-way split

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

21

Splitting Based on Nominal Attributes

 Multi-way split: Use as many partitions as distinct values.

Binary split: Divides values into two subsets.
 Need to find optimal partitioning.

© Tan,Steinbach, Kumar

Introduction to Data Mining

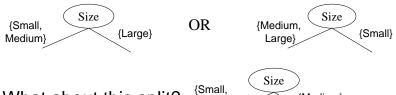

4/18/2004

Splitting Based on Ordinal Attributes

Multi-way split: Use as many partitions as distinct values.

Binary split: Divides values into two subsets.
 Need to find optimal partitioning.

{Medium}

23

Splitting Based on Continuous Attributes

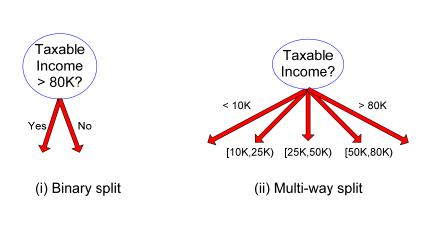

- Different ways of handling
 - Discretization to form an ordinal categorical attribute
 - Static discretize once at the beginning
 - Dynamic ranges can be found by equal interval bucketing, equal frequency bucketing (percentiles), or clustering.
 - Binary Decision: (A < v) or $(A \ge v)$
 - consider all possible splits and finds the best cut
 - can be more compute intensive

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

How to determine the Best Split

Before Splitting: 10 records of class 0, 10 records of class 1

Which test condition is the best?

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

27

How to determine the Best Split

- Greedy approach:
 - Nodes with homogeneous class distribution are preferred
- Need a measure of node impurity:

C0: 5 C1: 5 C0: 9 C1: 1

Non-homogeneous, High degree of impurity Homogeneous,

Low degree of impurity

© Tan,Steinbach, Kumar

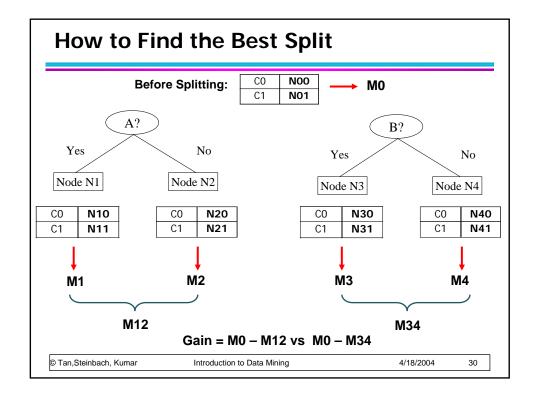

Introduction to Data Mining

4/18/2004

Measures of Node Impurity

- Gini Index
- Entropy
- Misclassification error

© Tan,Steinbach, Kumar Introduction to Data Mining 4/18/2004 29

Measure of Impurity: GINI

• Gini Index for a given node t:

$$GINI(t) = 1 - \sum_{j} [p(j|t)]^{2}$$

(NOTE: $p(j \mid t)$ is the relative frequency of class j at node t).

- Maximum (1 1/n_c) when records are equally distributed among all classes, implying least interesting information
- Minimum (0.0) when all records belong to one class, implying most interesting information

C1	0	
C2	6	
Gini=0.000		

C1	1
C2	5
Gini=0.278	

C1	2
C2	4

Introduction to Data Mining

4/18/2004

31

Examples for computing GINI

$$GINI(t) = 1 - \sum_{j} [p(j|t)]^{2}$$

$$P(C1) = 0/6 = 0$$
 $P(C2) = 6/6 = 1$
 $Gini = 1 - P(C1)^2 - P(C2)^2 = 1 - 0 - 1 = 0$

P(C1) =
$$1/6$$
 P(C2) = $5/6$
Gini = $1 - (1/6)^2 - (5/6)^2 = 0.278$

$$P(C1) = 2/6$$
 $P(C2) = 4/6$
 $Gini = 1 - (2/6)^2 - (4/6)^2 = 0.444$

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

Splitting Based on GINI

- Used in CART, SLIQ, SPRINT.
- When a node p is split into k partitions (children), the quality of split is computed as,

$$GINI_{split} = \sum_{i=1}^{k} \frac{n_i}{n} GINI(i)$$

where, n_i = number of records at child i, n = number of records at node p.

© Tan,Steinbach, Kumar

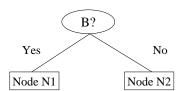

Introduction to Data Mining

4/18/2004

33

Binary Attributes: Computing GINI Index

- Splits into two partitions
- Effect of Weighing partitions:
 - Larger and Purer Partitions are sought for.

	Parent	
C1	6	
C2	6	
Gini = 0.500		

Gini(N1) $= 1 - (5/7)^2 - (2/7)^2$

= 0.408

Gini(N2)

 $= 1 - (1/5)^2 - (4/5)^2$

	N1	N2	
C1	5	1	
C2 2 4			
Gini-0 371			

Gini(Children)

= 7/12 * 0.408 + 5/12 * **0.32**

= 0.371

C1	2	2	
C2	1 5		
Gini	0.419		

© Tan,Steinbach, Kumar Introduction to Data Mining 4/18/2004 35

Continuous Attributes: Computing Gini Index

- Use Binary Decisions based on one value
- Several Choices for the splitting value
 - Number of possible splitting valuesNumber of distinct values
- Each splitting value has a count matrix associated with it
 - Class counts in each of the partitions, A < v and A ≥ v
- Simple method to choose best v
 - For each v, scan the database to gather count matrix and compute its Gini index
 - Computationally Inefficient!
 Repetition of work.

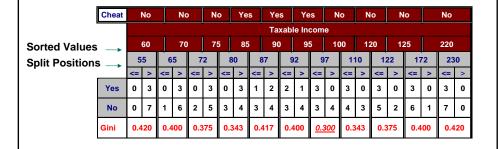

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

Continuous Attributes: Computing Gini Index...

- For efficient computation: for each attribute,
 - Sort the attribute on values
 - Linearly scan these values, each time updating the count matrix and computing gini index
 - Choose the split position that has the least gini index

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

37

Alternative Splitting Criteria based on INFO

Entropy at a given node t:

$$Entropy(t) = -\sum_{j} p(j|t) \log p(j|t)$$

(NOTE: $p(j \mid t)$ is the relative frequency of class j at node t).

- Measures homogeneity of a node.
 - Maximum (log n_c) when records are equally distributed among all classes implying least information
 - Minimum (0.0) when all records belong to one class, implying most information
- Entropy based computations are similar to the GINI index computations

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

Examples for computing Entropy

$$Entropy(t) = -\sum_{j} p(j | t) \log_{2} p(j | t)$$

$$P(C1) = 0/6 = 0$$
 $P(C2) = 6/6 = 1$
Entropy = $-0 \log 0 - 1 \log 1 = -0 - 0 = 0$

$$P(C1) = 1/6$$
 $P(C2) = 5/6$
Entropy = - (1/6) log_2 (1/6) - (5/6) log_2 (5/6) = 0.65

$$P(C1) = 2/6$$
 $P(C2) = 4/6$
Entropy = - (2/6) log_2 (2/6) - (4/6) log_2 (4/6) = 0.92

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

39

Splitting Based on INFO...

Information Gain:

$$GAIN_{split} = Entropy(p) - \left(\sum_{i=1}^{k} \frac{n_{i}}{n} Entropy(i)\right)$$

Parent Node, p is split into k partitions;

n_i is number of records in partition i

- Measures Reduction in Entropy achieved because of the split. Choose the split that achieves most reduction (maximizes GAIN)
- Used in ID3 and C4.5
- Disadvantage: Tends to prefer splits that result in large number of partitions, each being small but pure.

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

Splitting Based on INFO...

Gain Ratio:

$$GainRATIO_{split} = \frac{GAIN_{split}}{SplitINFO} SplitINFO = -\sum_{i=1}^{k} \frac{n_i}{n} \log \frac{n_i}{n}$$

Parent Node, p is split into k partitions n_i is the number of records in partition i

- Adjusts Information Gain by the entropy of the partitioning (SplitINFO). Higher entropy partitioning (large number of small partitions) is penalized!
- Used in C4.5
- Designed to overcome the disadvantage of Information Gain

© Tan,Steinbach, Kumar Introduction to Data Mining 4/18/2004 41

Splitting Criteria based on Classification Error

Classification error at a node t :

$$Error(t) = 1 - \max_{i} P(i \mid t)$$

- Measures misclassification error made by a node.
 - Maximum (1 1/n_c) when records are equally distributed among all classes, implying least interesting information
 - Minimum (0.0) when all records belong to one class, implying most interesting information

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

Examples for Computing Error

$$Error(t) = 1 - \max_{i} P(i \mid t)$$

C1	0
C2	6

$$P(C1) = 0/6 = 0$$
 $P(C2) = 6/6 = 1$
 $Error = 1 - max(0, 1) = 1 - 1 = 0$

$$P(C1) = 1/6$$
 $P(C2) = 5/6$
Error = 1 - max (1/6, 5/6) = 1 - 5/6 = 1/6

$$P(C1) = 2/6$$
 $P(C2) = 4/6$
Error = 1 - max (2/6, 4/6) = 1 - 4/6 = 1/3

43

Comparison among Splitting Criteria

For a 2-class problem:

Tree Induction

- Greedy strategy.
 - Split the records based on an attribute test that optimizes certain criterion.
- Issues
 - Determine how to split the records
 - How to specify the attribute test condition?
 - How to determine the best split?
 - Determine when to stop splitting

© Tan,Steinbach, Kumar Introduction to Data Mining 4/18/2004 46

Stopping Criteria for Tree Induction

- Stop expanding a node when all the records belong to the same class
- Stop expanding a node when all the records have similar attribute values
- Early termination (to be discussed later)

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

Decision Tree Based Classification

- Advantages:
 - Inexpensive to construct
 - Extremely fast at classifying unknown records
 - Easy to interpret for small-sized trees
 - Accuracy is comparable to other classification techniques for many simple data sets

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

48

Example: C4.5

- Simple depth-first construction.
- Uses Information Gain
- Sorts Continuous Attributes at each node.
- Needs entire data to fit in memory.
- Unsuitable for Large Datasets.
 - Needs out-of-core sorting.
- You can download the software from: http://www.cse.unsw.edu.au/~quinlan/c4.5r8.tar.gz

0.5

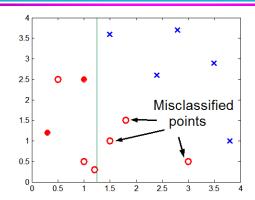

٥L

Introduction to Data Mining

4/18/2004

53

Overfitting due to Insufficient Examples

Lack of data points in the lower half of the diagram makes it difficult to predict correctly the class labels of that region

- Insufficient number of training records in the region causes the decision tree to predict the test examples using other training records that are irrelevant to the classification task

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

How to Address Overfitting

- Pre-Pruning (Early Stopping Rule)
 - Stop the algorithm before it becomes a fully-grown tree
 - Typical stopping conditions for a node:
 - Stop if all instances belong to the same class
 - Stop if all the attribute values are the same
 - More restrictive conditions:
 - Stop if number of instances is less than some user-specified threshold
 - Stop if class distribution of instances are independent of the available features (e.g., using χ^2 test)
 - Stop if expanding the current node does not improve impurity measures (e.g., Gini or information gain).

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

59

How to Address Overfitting...

- Post-pruning
 - Grow decision tree to its entirety
 - Trim the nodes of the decision tree in a bottom-up fashion
 - If generalization error improves after trimming, replace sub-tree by a leaf node.
 - Class label of leaf node is determined from majority class of instances in the sub-tree
 - Can use MDL for post-pruning

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

Handling Missing Attribute Values

- Missing values affect decision tree construction in three different ways:
 - Affects how impurity measures are computed
 - Affects how to distribute instance with missing value to child nodes
 - Affects how a test instance with missing value is classified

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

63

Other Issues

- Data Fragmentation
- Search Strategy
- Expressiveness
- Tree Replication

Data Fragmentation

- Number of instances gets smaller as you traverse down the tree
- Number of instances at the leaf nodes could be too small to make any statistically significant decision

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

68

Search Strategy

- Finding an optimal decision tree is NP-hard
- The algorithm presented so far uses a greedy, top-down, recursive partitioning strategy to induce a reasonable solution
- Other strategies?
 - Bottom-up
 - Bi-directional

© Tan,Steinbach, Kumar

Introduction to Data Mining

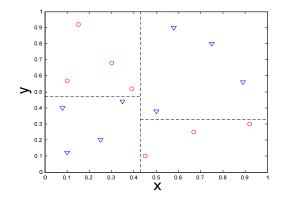

4/18/2004

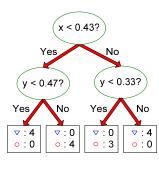

Expressiveness

- Decision tree provides expressive representation for learning discrete-valued function
 - But they do not generalize well to certain types of Boolean functions
 - Example: parity function:
 - Class = 1 if there is an even number of Boolean attributes with truth value = True
 - Class = 0 if there is an odd number of Boolean attributes with truth value = True
 - For accurate modeling, must have a complete tree
- Not expressive enough for modeling continuous variables
 - Particularly when test condition involves only a single attribute at-a-time

© Tan,Steinbach, Kumar Introduction to Data Mining 4/18/2004 70

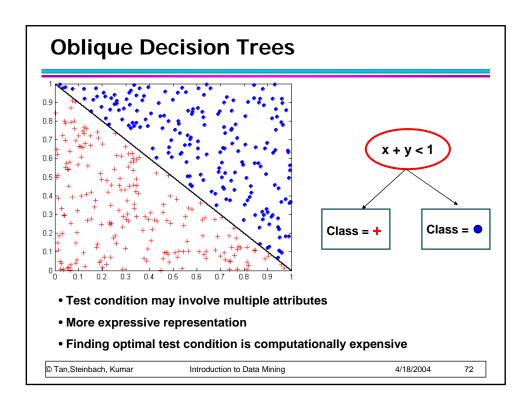

Decision Boundary

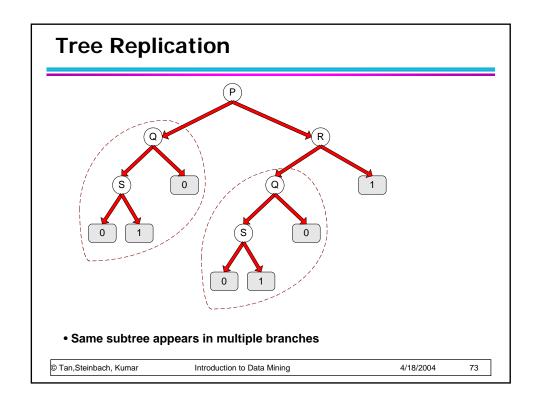

- Border line between two neighboring regions of different classes is known as decision boundary
- Decision boundary is parallel to axes because test condition involves a single attribute at-a-time

© Tan,Steinbach, Kumar Introduction to Data Mining 4/18/2004 71

Model Evaluation

- Metrics for Performance Evaluation
 - How to evaluate the performance of a model?
- Methods for Performance Evaluation
 - How to obtain reliable estimates?
- Methods for Model Comparison
 - How to compare the relative performance among competing models?

- Methods for Model Comparison
 - How to compare the relative performance among competing models?

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

Metrics for Performance Evaluation

- Focus on the predictive capability of a model
 - Rather than how fast it takes to classify or build models, scalability, etc.
- Confusion Matrix:

	PREDICTED CLASS		
		Class=Yes	Class=No
ACTUAL CLASS	Class=Yes	а	b
	Class=No	С	d

- a: TP (true positive)
- b: FN (false negative)
- c: FP (false positive)
- d: TN (true negative)

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

76

Metrics for Performance Evaluation...

	PREDICTED CLASS		
		Class=Yes	Class=No
ACTUAL CLASS	Class=Yes	a (TP)	b (FN)
	Class=No	c (FP)	d (TN)

Most widely-used metric:

Accuracy =
$$\frac{a+d}{a+b+c+d} = \frac{TP+TN}{TP+TN+FP+FN}$$

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

Limitation of Accuracy

- Consider a 2-class problem
 - Number of Class 0 examples = 9990
 - Number of Class 1 examples = 10
- If model predicts everything to be class 0, accuracy is 9990/10000 = 99.9 %
 - Accuracy is misleading because model does not detect any class 1 example

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

78

Cost Matrix

	PREDICTED CLASS		
ACTUAL CLASS	C(i j)	Class=Yes	Class=No
	Class=Yes	C(Yes Yes)	C(No Yes)
	Class=No	C(Yes No)	C(No No)

C(i|j): Cost of misclassifying class j example as class i

© Tan,Steinbach, Kumar Introduction to Data Mining 4/18/2004

Computing Cost of Classification

Cost Matrix	PREDICTED CLASS		
	C(i j)	+	-
ACTUAL CLASS	+	-1	100
	-	1	0

Model M ₁	PREDICTED CLASS		
ACTUAL CLASS		+	•
	+	150	40
	•	60	250

Model M ₂	PREDICTED CLASS		
ACTUAL CLASS		+	•
	+	250	45
OLAGO	-	5	200

Accuracy = 80%

Cost = 3910

Accuracy = 90%

Cost = 4255

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

80

Cost-Sensitive Measures

Precision (p) =
$$\frac{a}{a+c}$$

Recall (r) =
$$\frac{a}{a+b}$$

F-measure (F) =
$$\frac{2rp}{r+p}$$
 = $\frac{2a}{2a+b+c}$

- Precision is biased towards C(Yes|Yes) & C(Yes|No)
- Recall is biased towards C(Yes|Yes) & C(No|Yes)
- F-measure is biased towards all except C(No|No)

Weighted Accuracy =
$$\frac{w_1 a + w_4 d}{w_1 a + w_2 b + w_3 c + w_4 d}$$

© Tan,Steinbach, Kumar

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

83

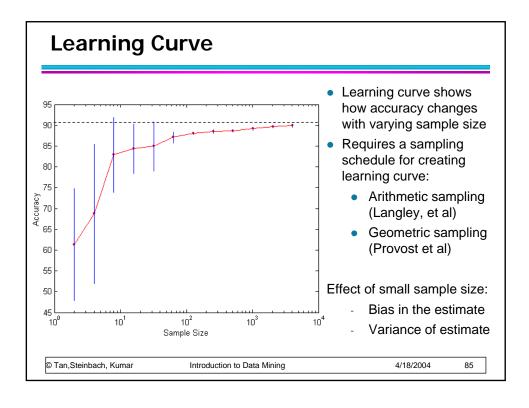

Methods for Performance Evaluation

- How to obtain a reliable estimate of performance?
- Performance of a model may depend on other factors besides the learning algorithm:
 - Class distribution
 - Cost of misclassification
 - Size of training and test sets

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

Methods of Estimation

- Holdout
 - Reserve 2/3 for training and 1/3 for testing
- Random subsampling
 - Repeated holdout
- Cross validation
 - Partition data into k disjoint subsets
 - k-fold: train on k-1 partitions, test on the remaining one
 - Leave-one-out: k=n
- Stratified sampling
 - oversampling vs undersampling
- Bootstrap
 - Sampling with replacement

Introduction to Data Mining

4/18/2004

87

ROC (Receiver Operating Characteristic)

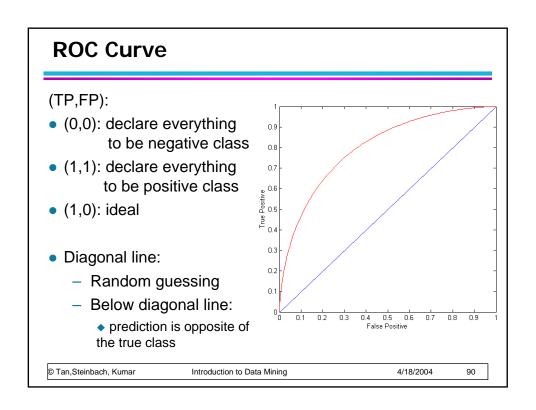

- Developed in 1950s for signal detection theory to analyze noisy signals
 - Characterize the trade-off between positive hits and false alarms
- ROC curve plots TP (on the y-axis) against FP (on the x-axis)
- Performance of each classifier represented as a point on the ROC curve
 - changing the threshold of algorithm, sample distribution or cost matrix changes the location of the point

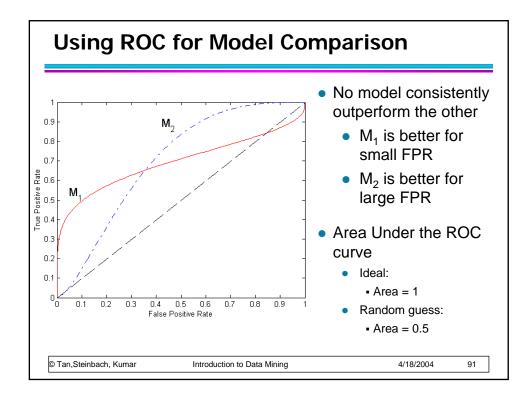

© Tan,Steinbach, Kumar

Introduction to Data Mining

4/18/2004

ROC Curve - 1-dimensional data set containing 2 classes (positive and negative) - any points located at x > t is classified as positive Positive Class Negative 0.8 0.012 0.01 0.6 1.0 Dositive 0.5 O.4 0.008 0.004 0.002 0.2 0.1 At threshold t: 0.4 0.5 C False Positive TP=0.5, FN=0.5, FP=0.12, FN=0.88 © Tan,Steinbach, Kumar 4/18/2004 Introduction to Data Mining 89

How to Construct an ROC curve

P(+ A)	True Class
0.95	+
0.93	+
0.87	-
0.85	-
0.85	-
0.85	+
0.76	-
0.53	+
0.43	-
0.25	+
	0.95 0.93 0.87 0.85 0.85 0.76 0.53 0.43

- Use classifier that produces posterior probability for each test instance P(+|A)
- Sort the instances according to P(+|A) in decreasing order
- Apply threshold at each unique value of P(+|A)
- Count the number of TP, FP, TN, FN at each threshold
- TP rate, TPR = TP/(TP+FN)
- FP rate, FPR = FP/(FP + TN)
